Painting pressure control equipment

Discussion

Painting equipment in the field.

Recommendation

Texas Oil Tools recommends that when the equipment in the field must be painted that the following guidelines be followed:

Sand the areas that need to be painted, feathering out the edges. Do not blast any pressure control equipment.

Mask off areas that must not be painted. Mask off the weep holes, ring grooves exposed threads, indicator rods, Side Door piston, and any sealing surface.

Prime and paint the equipment to your primer, top coat and clear coat specifications.
