

# Focsani Water Company found pump protection with our Series A Muncher

## Background

Focsani Water Co. was extracting and cleaning their pumps weekly because of frequent blocking due to build up of rags and fibers, severely increasing the time required for maintenance and reducing the amount of operational time. The company struggled to find a cost-effective solution to deal with these problems.

## Solution

We proposed our Series A Muncher in front of the pumps to protect them from future blockage by reducing the particle sizes of the flow going through. The final plan, which was determined by the company's designers and technicians, was to implement 20 Series A Munchers, which successfully reduced downtime and provided uninterrupted support for the local community.

## Results

- Prevented blockages
- Significantly reduced downtime
- Cut down maintenance costs
- Resolved ongoing ragging issues
